

Lab 2 – Lab Reflection

SRN: PES1UG24AM221

System: Domain & SSL Certificate Expiry Alert System

1. What I Learned

In this lab, I learned how Agile Scrum practices can be applied to manage software development work using Jira. I learned how requirements can be converted into Epics and User Stories, estimated using Story Points, prioritised, and organised into a Product Backlog. I also learned how sprint progress can be tracked using a Scrum board and Burndown Chart.

2. Agile Backlog Experience

For the Domain & SSL Certificate Expiry Alert System, I created three Epics: Domain & Certificate Monitoring, Alert & Escalation Management, and Audit & System Management. I then created ten User Stories and assigned Fibonacci-based Story Point estimates. The backlog was prioritised and ranked according to the importance of the system functionality.

3. Sprint Execution Experience

I divided the backlog into two mock Scrum sprints. Sprint 1 contained six User Stories with a total of 24 Story Points, while Sprint 2 contained four User Stories with a total of 18 Story Points. I simulated the Scrum workflow by moving work items through To Do, In Progress, and Done, and added comments to completed work items.

4. Challenges Faced

One challenge was organising the backlog correctly while maintaining the required priorities, story-point estimates, and sprint allocation. Another challenge was understanding how Jira represents sprint progress and ensuring that the work items were moved through the correct workflow states so that the Burndown Charts reflected the completed work.

5. Skills Developed

This lab improved my skills in Agile Scrum planning, backlog management, User Story creation, Story Point estimation, prioritisation, sprint planning, Jira workflow management, and progress tracking. I also gained practical experience in using Burndown Charts to understand remaining work and sprint completion.

6. Overall Reflection

Overall, this lab gave me practical experience in managing software development work using an Agile approach. It helped me understand how requirements can be broken into manageable User Stories and delivered incrementally through sprints. Using Jira also showed me how visual project-tracking tools can support planning, execution, and monitoring of Agile projects.
